CHAPTER-7

NATIONAL EDUCATION POLICY-2020 AND ONLINE EDUCATION

¹Prof. Manoj Kumar Saxena & ²Ambika Kanwar

ABSTRACT

NEP 2020 endeavours to make education accessible, equitable and inclusive to all. The policy is also looking forward to implement blended learning, i.e., combining online learning with traditional learning. Online education is easily accessible; it fulfils the diverse needs of every learner as one can learn at its own pace. Students may take lessons without geographical boundaries, and institutions can reach out to an extensive network of students instead of being limited by physical borders. In the present paper, the authors have highlighted the need and challenges of implementing NEP 2020 and online education. An attempt has been made to give few recommendations and suggestions to overcome these challenges.

KEYWORDS: Online Education, Accessible, Asynchronously and Synchronously.

INTRODUCTION

The education system of a country is the backbone for its overall growth as a nation. To make the system of education uniform and as per the latest developments, the National Education Policy 2020 (NEP 2020) is being implemented. Keeping pace with times, this policy is a need of the hour and it is expected that it will upgrade the present education system. The policy has many brilliant features. Making education accessible, equitable and inclusive to bridge the gap in learning outcomes is the main aim of the policy (Saxena, 2020). Along

Introduction:

In the present-day smartphone has become an essential part of our life especially among the younger age group. Over the last few years, growth of smartphone operating systems and competition among cellular phone manufacturers is high. This competent world created various devices to provide numerous facilities to its users in every part of our lives such as; connecting to the internet, capture photos, entertainment, finding of addresses and road routes, making reservations, banking, online shopping, playing games, storing and distributing information, organizing classes and so many other activities that can be done with smartphone (Emanuel et al. 2015). The mobile phone has made our daily lives and routine easier, on the other hand it may generate harmful effects on its users such as restlessness, worries, terror or conflict due to excessive use of it. Excessive use of anything is bad and so is the case with technology. Overuse of technology including smartphone can lead to compulsion and this compulsion creates negative impact on the mental and physical health of its users. It can be seen anywhere that people become worried without their smartphone or when there is no set of connections or battery has exhausted or balance is not there, definitely affecting the concentration level of people in a depressing way. This type of state of a person is known as Nomophobia.

Nomophobia:

Nomophobia is defined as, irrational fear of being without mobile phone (Vanitha, 2014). The term, nomophobia, means No-Mobile-Phone-Phobia and it was first coined during 2010 by the UK post office who commissioned you-Gov, a UK- based research organisation and two other terms were also introduced and colloquially used: nomophobe, it is a person who is affected with nomophobia and the word nomophobic is describing the uniqueness of person who is affected with nomophobia (Kanmani, et al., 2017). Nomophobia is a worry which people face during the use of their smartphone i.e. signal was not there in phone, battery was depleting, phone was not carry with them and notification was not received by certain period of time they become anxious and this anxiousness create various psychological problem among younger generation (Yildirim et al., 2016).

Nomophobia, is a state of worry, uneasiness or distress due to unavailability of smartphone. Many people suffer from "No Mobile Phone Phobia". Nomophobia is irrational fear introduced in our lives due to technological advancement and reliance on them. Smartphone reliance can be classified as machinery addiction. Such type of behaviour leads to various psychological problems like lack of patience, useless efforts, low achievements, dishonest associations with their family members and ignorance towards some area of life due to overdependence of these technologies.

Nomophobia is a kind of phobia which is due to detachment from mobile phone or its connectivity. Individuals, especially younger generation, who are exposed to nomophobia express that they experience anxiety, when they are not able to use this portable device and not able to collect or exchange information through mobile phones, battery charge is depleted or signal was not in their phone, these are some causes of Nomophobia. Nomophobia

Abstract

Today, is a time when no one can think of surviving without two things, first being education and second the internet. If education can make a person self-dependent then the digital technology is a tool which helps the person to reach out to the best knowledge and its resources. With the boom in digital technology, regulators and educationists have come up with different strategies and policies to make the best use of digital era. In India, educational policies have always been focused to mitigate the hindrances owing to diversified culture thereby in bringing the education and quality educational resources to each & every person. The OERs and MOOCs platform have come up as an encouragement to reinforce this goal. These are ICT tools which provide access to free educational material and courses. The educational content can be shared with almost negligible or limited copyright license in different digital forms or in print media. Currently, Creative Common License is a requisite for OERs for disposal while MOOCs may have copyright. This paper aims to give the understanding of OERs and its chronological emergence signifying its contemporary essence while inquiring the posed challenges. Further, the authors have also discussed the vital role of internet in education. While analyzing the chronology of OERs, the researchers have overviewed the technological advancement in internet which played parallel implications to blur the boundaries in education and tried to discuss how the OERs are a new hope for education.

Introduction

The present time is embraced with digital technology. Internet technology has greatly influenced the way of living, in almost every aspect. Internet makes possible and easy to reach out every corner of the world and individual without any discrimination. It not only stimulates life of people in their work, but also provides prominence to education system of the world. The students and teachers in Higher education are benefitted with internet in many ways. The very basic function of internet is communication and information (Warren et. al. 1998) in no time, but it achieved its popularity in education as one of the advantages of internet is that it does not discriminate on the basis of nationality, caste, gender, or descent places etc. Because of this caliber internet facilitates the online learning and contributes in the initiatives like open education movement and right to education. As the internet becomes more assessable with time, it smoothed the path to for OERs (Open Educational Resources) and MOOCs (Massive Open Online Courses). The term OER was firstly coined by UNESCO (United Nations Educational, Scientific and Cultural Organization) in 2002 at UNESCO forum (Miao, Mishra & McGreal, 2016). The OER can be define as the educational, teaching, learning or research materials which are freely available at digital or in other media and resides in public domain or with open license (OECD, 2007) which permits the 5R's i.e

Introduction

India is at the cusp of becoming the world's most populous country with its population estimated to increase to 1.45 billion by 2028, surpassing that of China. While many argue that most of India's challenges arise due to its large population base, the flipside is that more than 60% of its current population is in the age group of 15 to 59 years; which makes India home to the largest employable manpower base. The demographic dividend indicates a tremendous supply of the working age population. However, the real question for India's business houses and the government is: "Is this manpower really skilled to be employable?". In order to steer India towards higher economic growth, it has become imperative to utilise this demographic dividend through skill development and increasing employability. Infusion of foreign skill providers and their ways and means to establish skills would provide a fresh perspective to the Indian skill segment. However, the initiatives by foreign skill development providers over the last few years have met with limited success. With a meagre 2.4 per cent of existent landmass, India has been a homeland for 17.5 per cent of total population of the globe. The distribution of Indian population is concentrated more in urban landscapes throughout the country. After almost eight decades after independence, India is gradually making her way to be among economically developed nations. However, the pace of development can be accelerated largely with a right approach to an all-inclusive progress. Diversity has been a unique identity of

Problem Based Learning as an Innovative Approach for Empowering the Creative and Critical Thinking Skills in Higher Education

Manoj Kumar Saxena & Anu G. S.

Introduction

The 21st century is characterized by the emergence of multi-culturalism due to the integration of industrialization, urbanization, liberalization, privatization, globalization and even googlization!. With the advent of technological advancement in the 21st century the life has become ever changing. Resultantly, the area of teaching had changed to a vast extent. Now, the focus is on how we learn and a determined drive has been on the move to develop an educational system that helps children learn more effectively for life. This would include students developing an understanding of their own learning profile and how to use it to raise achievement and develop their full potential. Teachers, students and parents need to understand their learning styles and how to engage

E-WASTE: WHAT STEP REVEALS— INDIA AND WORLD

Manoj Kumar Saxena, Ravi Raj

INTRODUCTION

The technological world saw rapid innovations and advancements in near past which has sprouted out a new wave of e-waste in the field of digitalization. Today computers or laptops, tablets and other electronic accessories are spreading and being marketed out rapidly which soon come back to the waste market within the gap of five to ten years. There is no deny to the technological advancements and robotic life due to human efficient achievement in space but it becomes secondly when we see the military spaceships and more distorting when the talk of floating or dead spaceships comes. These aspects need to be carried further in the light of environment and proper attention needs to be imparted. E-waste is hazardous waste and studies are being carried on globally for its management. The major cause behind the arousal of electronic waste or so called e-waste is the shorter lifespan of electronic products which is a result of improper usage and mishandling. The previous technology in spite of living its life is being engulfed by the new technological advancements at a much rapid pace. The remainders of old electronic equipment's including the discarded computers, printers, televisions, VCRs, stereos, copiers, palmtop, i-pod, pen drives, external hard disks, cell phones, audio equipment and batteries, which if improperly disposed can leach the heavy metals and other hazardous substances into soil and groundwater causing contamination. According to StEP (2014), e-Waste is a term used to cover items of all types of electrical and electronic equipment (EEE) and its parts that have been discarded by the owner as waste without the intention of re-use". Often these hazards arise due to improper recycling, organizational failure and unsafe disposal process being carried out at

ABSTRACT

In developing countries like India, technology was gifted by developed, gifted which provided the universal access to education, equity in education by modifying the arena of teacher - learner interaction and behavior with shaping process of learning, teaching, professional and vocational development in tertiary education. There was widespread use of electronic products contributing to universal and equity in education in globalized economy. The lack of awareness caused unrestrained resource consumption and an alarming waste generation particularly of e-Waste. Awareness and understanding provides a basis and rationale for commitment and meaningful action towards sound and sustainable development. This paper deals with awareness and generation of e-waste in higher educational institutions of district Kangra, Himachal Pradesh.

Keywords: E-waste, Environment, Higher Education, Kangra

INTRODUCTION

E-waste refers to discarded electrical and electronic equipment Gupta, N. & Sekhar, G. L. (2009). The electronic equipment which is of no longer use comes in the category of e-Waste. "e-Waste" is a popular, informal name for electronic products nearing the end of their "useful life". e-Waste includes waste cathode ray tube (CRT) televisions, desktops, laptops, CRT monitors, liquid crystal display (LCD) monitors, cell phones, keyboards, computer mice, printers, and copier Gupta, S. (2011) e-Waste might seem to be a "buzz" in the walks of waste to the common man and might look like a scar if categorized as one of the major results of globalization and education. The quantification of the e-waste along other waste is one of the major problems in its quantitative generalization. The e-waste is generally collected along with the other wastes and comes in the market with foreign indirect inflow The main hindrance in generalizing the e-Waste is inflow of electronic waste into the domestic market. Moreover each economy (some countries have different categorization due to the variation of electronic products being consumed per capita.) has its own categorization and nature for e-waste; leaving apart to hindrances created by differences in definitions of e-Waste constituents which create disparity.

Abstract—Development of technology has made a rapid change and growth which has added a new dimension to visualise the things in a different way. The use of ICT can be seen in every walk of life. Therefore it is the need of the hour that one must learn about ICT, with ICT and through ICT. Integration of technological gadgets act as catalyst in the quality enhancement but on the same time it leads to the prologue of barriers for the teacher to integrate ICT in teaching learning process. Today our education system is learner centred where the teacher plays the role of mentor. Teacher has to pay more attention to create problem solving environment and make students able to grasp at their own pace. So that the students may also be able to use ICT in their daily lives in general and in their studies in particular. In the present scenario, the teacher has to use ICT in his day to day working. For this situation, a teacher has to stand with the new technological advancements and fast changes. Teachers has to prepare themselves to upbeat with the technological changes, ready to learn, Inquire and update his knowledge with the pace of time. But in the prevailing situation, the integration of ICT in teaching learning process is in infancy stage due to barriers faced by teachers in integrating ICT in their teaching process. Thus the researchers have tried to find out various barriers that are being faced by a teacher. The present study makes an attempt to investigate the various barriers that are being encountered by tertiary teachers during their teaching. Some suggestions to overcome these barriers have also been given in the present study.

Keywords: Teachers, ICT Barriers, Teaching-Learning Process

INTRODUCTION

ICT is a growing aspect of technology in the field of education. With splash of time ICT has made change in the outlook of our education making a new paradigm shift in education (Pelgrum, 2001). Previously, the education oscillated in traditional mind set where the main stage was setup by the teachers they inculcated the values of education in the learner. Now the education has become more oriented towards the learner and prepare the learner to develop his critical abilities by involving in more problem solving activities. These new technologies are significant as they work on the principle of individual differences, it considers that every individual has its own individuality and he/she works according to his/her own pace. This well equipped technology was further named as ICT. Which when used in the field of education it adds a new quality dimension; it enhances teaching-learning process by adding a new look to the traditional teaching method.

Abstract—Information Technology is considered as backbone of 21st century. In early nineties, the role of Information Technology was limited to Multi National Companies establishing in India but now its scope is expanding very wide. It is widely used in almost all of the areas of life. The rapid development in the field of Information technology has captured the attention of academicians and the information technology peeped up in to the field of education. The one of the important function of information technology in education is governance, commonly known as E-Governance. The concept of e-governance has been introduced in the field of education to improve output and efficiency of institutions. E-Governance in education means to use available ICT facilities for smooth functioning and improving higher educational institutions by making administration accountable and transparent. It helps to make an institution a global educational institution by overcoming geographical barriers by reaching up to prospective students, present students and staff by mean of e-mails, chat, mobile etc., new ways of imparting education. Most of the higher educational institutions in India are implementing e-governance to provide quality experience of different services to faculties and other stakeholders. This paper examines the need of e-governance in education, its effectiveness and the various challenges to integrate it in higher educational institutions.

Keywords: Education, Information Technology, E-governance

INTRODUCTION

Today we are living in the world of information technology. The Information Technology and its applications are being widely used in all walks of life be it used in tourism, multinational companies, banking, entertainment, whether forecasting, communication, business, reservations, agriculture, medicines, management, laws and justice etc. It is considered as the driving force of economic growth. The power of information technology is greatly enhanced by communication technology, it means that connectivity (through wireless, cell phones technology or over cables) is the crucial feature that allow access to internet and the World Wide Web (Balasubramanian, et al., 2009). The tremendous use of information technology also influences the field of education. E-governance rides on advances of Information and Communication Technology like the internet, local area networks and mobiles to improve effectiveness, efficiency and service delivery thereby promising speedy information, dissemination, higher administrative efficiency and improved public services (Vijaykumar, 2011). The main aim of introducing e-governance in education is to improve quality, efficiency, effectiveness and smooth functioning of education system. The rapidly increasing student population in higher education demands the need for e-governance to process, store and retrieve data in fast and accurate manner. Thus, most of the higher educational institutions in

QUALITY DEVELOPMENT IN TEACHER EDUCATION

Sandhya Gihar*

Manoj Kumar Saxena**

As we know that the book of knowledge has no last page. It is correct in case of a teacher. The teacher is always in learning phase. His thrust for knowledge never ends. In India, long back, the teachers were worshipped by their students. At that time the prince or princesses were stayed at gurukuls and there they learn about all the spheres of life. In our Indian culture, many teachers like, Kapil, Vishwamitra, Vashishtha, Parshuram, Balmiki, Chanakya etc. have transformed the then culture to their pupils very effectively (Gihar, Dey & Saxena, 2006). In ancient time teacher occupied a special place in the society. Teachers involve themselves throughout the life with the view of Tagore "A lamp can never light another lamp unless it continues to burn its own flame. Teacher is a most significant catalytic agent of society who influences the quality of education. Hence quality becomes an integral part of the educational system (Hegde, 2009) but unfortunately, we are passing through the critical stage of degradation of quality of teacher at every level. Educational quality is directly related to the quality of the teachers. We all know that no educational reform can be successful unless the quality of teacher is improved, but in turn the quality of teacher depends to a large extent on the quality of teacher education (Kothari & Shelat, 2009). Due to the technological revolution teacher

SOME REALISTIC CONCERNS OVER CURRENT TREND OF TEACHER EDUCATION IN INDIA

Manoj Kumar Saxena*

Students are future of nation and teacher is the person who moulds them in proper shape (Saxena, et.al., 2007). Teaching is said to be prophetic profession (Khan, 2005). The teacher has a pivotal role in our educational system. The whole education system moves around him. The teacher is a person who is responsible for desirable changes among his students (Saxena, 2006). Teachers are extremely important agents in the process of teaching and learning (Kukreti, 2004). Education is a process of human enlightenment and empowerment for the achievement of a better and high quality of life (Mohod and Mohod, 2003). The teacher is responsible for all round development of child together with the development of the society (Chakarborty, 1998). The educational institutions, schools, colleges, institutions of higher learning focus at improving the quality of life (Kukreti, et.al., 2004). But when we see the mushroom growth of teacher education institutes in India, it gives a very clumsy picture of teacher education which is not only disheartening but disappointing also. In present time, various affiliated 'sub standard self financed' teacher education institutions are exploiting students. Most of these institutions are not quality concerned; they are concerned with the return of their investment and hence their concern centres around the quantity only.

ATTITUDE OF SENIOR SECONDARY STUDENTS TOWARDS COMPUTER APPLICATION IN EDUCATION

Manoj Kumar Saxena*

Bhawna Rathour**

A teacher can enhance the teaching learning process with the help of computer (Dey & Saxena, 2005). If the students have favorable attitude towards computer, then there may be a change for them to be motivated in acquiring knowledge of computer. Therefore, the Computer knowledge is very much needed for the students. Internet can be used effectively to teach the students because internet can provide information on any topic within no time. Therefore, the computer knowledge is very necessary for students and teachers.

In the present condition, computers have become remarkably efficient tool of learners, teachers and school administration. The number of tasks related to school or college can significantly do by the use of computer. The teacher can also use computer in

INTRODUCTION

During last decade science and technology have changed the face of world (Dey, et. al., 2005). Due to this revolution, information can be accessed from any part of the world with the help of information communication technology. ICT is a new medium, a new way of representing, communicating and working with information (Kukreti & Saxena, 2004). ICT has emerged as one of the most important aspects of human life. Each and every human activity involves the use of ICT to some extent, may be visiting a departmental store, booking tickets, paying bills, getting medical check up done, gathering data, getting a book issued in the library, performing an experiment, making a document, writing an application or even communicating with friends. Use of ICT has made the life scientific and luxurious. Science has reduced considerably the time taken for performing a task. One of the most powerful developments

Role of Values in Teacher Effectiveness

*Manoj Kumar Saxena, B.R. Kukreti
Sandhya Gihar*

The all pervasive violence, brutality, apathy and lack of understanding that we see around us are the outcomes of a valueless society. Majority of man can, to any extent, to achieve power and wealth, the two ultimate destination in the present age. This is because of the total neglect of the process of inculcating values in our schools and colleges. Because of such a school environment the students are losing the purpose of life and they fail to distinguish between appearance and reality. In our educational institutions on certain occasions preaching of values is done but the "values cannot be promoted by repeating words". They need effective teachers who themselves are value oriented. It is our everyday experience to observe that children imitate their teachers not in words but in their behaviour. Teachers play a very significant role in inculcating values in children. The teachers' role in the total educational process is vital, as child's behaviour, attitude, interest, etc. are greatly influenced by teachers (Gupta, 2001)

In order to inculcate values in the students, the primary requirement is that he/she should have natural value fixation in him/her. Once a teacher's behaviour becomes value oriented, his power to influence the child increases resulting in a tremendous increase in his effectiveness. Today the erosion of values and all-pervading cynicism in the society has made it all the more obligatory to focus our attention on values. It is the teacher who can become the catalytic agent for imbibing

Methodology of Commerce Teaching in Communication Age

Dr. Manoj Kumar Saxena*

Teaching is said to be prophetic profession (Khan, 2005). The teacher has a pivotal position in our educational system. The whole education system moves around him. Teacher, taught and the classroom are the important parts of any educational system. The teacher is the person who is responsible for desirable change among his students through the curriculum. Teachers are extremely important agents in the process of teaching and learning (Kukreti, 2004). Education is a process of human enlightenment and empowerment for the achievement of a better and higher quality of life (Mohod & Mohod, 2003). The teacher is responsible for all round development of child together with the development of society (Chakarborty, 1998). National Commission on School Teachers (1983-85) has stated that the teacher must actively and freely associate himself as an essential and responsible partner, in the great tasks which the nation face. The qualities of a good teacher can be counted as the guide and guardian of the noble cultural traditions (Drokin, 1967) custodian of the future (Gandhi, 1970) sainted pioneer of civilization and moving force behind social, economic and cultural advancement (Page, 1971). Today a teacher is expected to be update and conscious of various explosions - explosion of knowledge, explosion of frustration, explosion of expectations and explosion of technology (Agarwal, 1988).

In the present time there are super fast changes taking place in all walks of life. We are living in the age of advanced communication. In this era, revolutionary changes are being seen everywhere, in living style, market scenario, technological advancement, globalization of trade and services, in which education is also one of the most important service. The needs of common men are increasing everyday with the launch of new products in the market. To satisfy these needs one needs resources and for that one has to cope with the pace of advancement. So is the case with teacher education. Unfortunately, we are sorry to say that most of the Indian Universities are following the same age-old syllabus. The system has not changed in case of teacher education, particularly in the area of pedagogy or teaching methods. Our pupil teachers are bound to cram the syllabus to get maximum marks in final written exams as well as in practical exams. Through present paper, the syllabus being followed by most of the Indian Universities for methods of teaching commerce has been analyzed in view of the changes in needs, innovations and pedagogy.

Commerce: It's Place in School Curriculum

Through B.Ed. programme, we prepare teachers for secondary education. Our student teachers are mainly prepared to teach in secondary and junior high school classes. Normally we have a state board of education and Central Board of Secondary

Attitude of Pupil Teachers Towards Computer Application in Education : An Empirical Study

Ms. Bani Dey*
Dr. Manoj Kumar Saxena**

Government is trying hard to introduce computers in schools and colleges for students of class VIth to XIIth. It has made a huge expenditure on providing computers to different schools and colleges. However, not much attention has been paid to those who will be responsible for introducing computers in real classrooms i.e. teacher who are the key personnel in the national development (Chellamani, 2005). Neither in-service nor pre-service teacher education is being geared for making teachers use these computers for enhancing the teaching learning effectiveness. It has been observed that certain teachers are very reluctant to use any new technology in general and computers in particular in their classroom teaching. So the training of personnel required for effective use of modern communication technology and computers on education (Shardindu, 2005). The teachers, we are preparing through our teacher education programmes particularly B.Ed. need to be concentrated upon in this regard. These are the real person who would handle teaching learning process in these schools and colleges in future. Anthony (1987) studied the relationship between teachers' attitudes as related to the computers in education. The study infers that teachers who were computer literate and who had a better understanding of computers were more likely to use computers in the classroom. Davis (1998) concluded that 95.80 percent of the early childhood teachers held positive attitudes towards the instructional use of computers in their classrooms. Choi (1991) revealed that the teachers with higher level of CAI implementation showed more positive attitude towards computers. Further the study showed that the level of facilities for educational computer uses was not found to be significantly related to teachers' attitudes towards computers and using computers. The results of the study of Naraynasamy & Thangaswamy (2001) inferred that in teacher training institutions nearly 65 to 80 percent teacher educators admitted that they were not able to perform variety of computer task whereas Gihar, Saxena & Kukreti (2005) indicated that 70 percent teacher educators accepted that they never used the computers and Internet facilities in the class room practices. Not many studies have been conducted to assess the attitude of pupil teachers towards computer application in education.

To know existing status of their attitude towards computer usage in education is immensely significant. Keeping the role of teacher educators in imparting computer knowledge in view, the present paper has been conceptualized.

Abstract

The rapid advent of science and technology particularly in the field of information and communication technology has changed the world scenario. The ubiquitous impact of technological advancement is discernible in every sphere and field of knowledge is no exception. Learning methodology and storage, dissemination and analyses of learning has undergone great changes. These changes generate thousands of new information in the already existing storehouse of knowledge. It has brought changes in pedagogy and curriculum content (Green and Gilbert, 1995). In the case of formal face-to-face teaching learning the new technologies provide effective tools that complement conventional teaching practices (Powar, 1996). These technologies assist the teacher and facilitate learning. Educational television, computers, tele-conferencing, E-mail, Fax, Tele-fax, Radio-pager, virtual classroom have emerged as the most effective mode of information transmission. Therefore, in the present context if we want the educational institutions to function as effective learning organizations, then we have to develop the physical and human resources according to the advancement of information and communication technology so that individual team and organizational learning effectiveness can be enhanced, to cope with the demands of the age. For this purpose, teachers have to be technology friendly and the professional skills and competencies of teachers can be inculcated in them through pre-service, in service training programmes, through these specific orientation, refresher courses, summer institutes, workshops etc. The responsibility of conducting all these programmes is borne by the teacher-training institutions. This further evokes a question whether the teacher training institutions are advanced enough to cope with the technological advancement because creating learning environment through chalk and talk method is gradually going to become an obsolete practice. New technological innovations in information and communication are rapidly replacing the old methodologies. Therefore, the challenge falls on the teacher training institutions to cope with the demands of technological advancement and accordingly to prepare the physical resources and generate expertise in human resources providing leadership to perspective and in-service teachers. The present paper aims to deliberate these issues.

INTRODUCTION

The rapid advent of science and technology particularly in the field of information and communication technology has changed the world scenario. The ubiquitous impact of technological advancement is discernible in every sphere and field of knowledge is no exception. Learning methodology and storage, dissemination and analyses of learning has undergone great changes. These changes generate thousands of new information in the already existed storehouse of knowledge. It has brought changes in pedagogy and curriculum content (Green and Gilbert, 1995). In the case of formal face-to-face teaching learning the new technologies provide effective tools that complement

Abstract

Learning Organisation (LO) is a multivalent term that invites myriads of interpretations. David Garvin defines it as an organization skilled at creating, acquiring and transferring knowledge and at modifying its behaviour to reflect new knowledge and insights (Garvin, 1993). Hawkins (1994) calls it a change at the heart of our understanding of learning, a shift from viewing learning as being abrupt facts to learning as a more multifaceted and dynamic process. It includes creation of a learning environment in the institution. Bateson (1979), Revans (1984) and Kolb (1984) all developed models of individual learning incorporating a process of thinking, planning, action and reflection (Hawkins, 1994). The approach adopted by Organised Learning (OL) theorists is that those organisations that learn can manage the change process more effectively than can those who do not (Cullen 1999, Massey & Walker 1999). These definitions explain the necessity of creating good and healthy learning environment in the institution Steiner (1998) interprets LO as an organization that is continually expanding its capacity to create its future. Efforts have been made to establish relationship between learning Organisation and Organised Learning. McHugh, Croves & Aker (1998) argue OL emphasises human resource management, training, knowledge and skill acquisition whilst the LO links to 'organisational capability' i.e. the tacit, experiential learning that often goes on unnoticed in organisations. Reynolds & Ablett (1998), on the other hand, argue that LO responds to and anticipates changes in the environment by proactive OL.

Senge (1990) described learning organization as a place where people continually expand their capacity to create results they truly desire where new and expansive pattern of thinking are nurtured, where collective aspiration is set free and where people are continually learning how to learn.

Some other prominent educationists (Cullen 1999; Massey & Walker 1999) believe that LO are those organisations that can manage the change process more effectively than can those who do not. Argyris and Schon (1978, 1991, 1996) found that organisations learn through the agency of individual members, yet some other academicians & researchers challenged this theory and emphasised that the system that works in effect has reciprocal nature and OL and LO influence vice-versa. To decipher their inter-related nature the necessity is to analyse the factors incorporated into these. Researches are being conducted to find and to analyse and work out the positive impact of learning organization.

Value Deterioration and Educational Management

Dr. B.R. Kukreti*
& Manoj Kumar Saxena**

Drought of Human Values

The world drought of human values caused by corrupt counter-culture and mafia in power can be arrested only by sublime principles says Justice Krishna Iyer and truly value deterioration in the society not only in India but all over the world has given wind to the all pervading corruption. The prevalent situation in human society can be described in the words of Dr. Hari Ram Jasta's (1990) ailing expression "falsehood is rife in the world and truth is being stifled". Hypocrisy is predominant, brother trusts not brother, virtue is vanishing, vice is on the increase. The big fish is swallowing little ones. Almost all the educationists feel helpless about deterioration in Human Values. Mathur opines that "the Valuelessness in education is due to the lack of clear philosophy on the part of the Government, that has in reality rejected the principles of assimilation fully imbibed in our cultural goal. Let beneficial thoughts come to us from the universe."
